# 4 Prompting Best Practices

*Write better prompts, get better results.*

## Be Specific

Don't say "make it look nice." Say "use a green and dark charcoal theme with rounded corners and clean spacing." The more detail you give, the closer the result will be to what you actually want.

## Build One Feature at a Time

Start small and add features one by one. Build the calculator first, then add the landing page. Trying to do everything in one prompt gives worse results and is harder to fix.

## Keep It Simple

Start with the basics and add complexity later. If you start complicated, it's harder to fix things when they go wrong. You can always ask Lovable to add more once the foundation is solid.

## Use Follow-Up Prompts to Refine

After Lovable builds something, send small follow-up prompts to fine-tune it. Things like "make the heading bigger" or "add more spacing between sections" or "change the button to a lighter green." Small tweaks are more reliable than big rewrites.

**PRO TIP** — What you put at the very beginning and at the very end of your prompt always carries more weight than what's in the middle. If there's something you really want Lovable to pay attention to, put it first or last.
